## Apple Tape Backup 40SC: How 1.1 Differs From 1.0

This article last reviewed: 31 March 1988

Backups taken with version 1.1 of Apple Tape Backup 40SC Software often take less time than those taken with version 1.0, even with exactly the same amount of data to back up. And a backup that requires a second tape cartridge with version 1.0 may need only one cartridge with version 1.1. Here's why:

- Version 1.0 backs up all sectors from the hard disk, both used and unused sectors. This is why version 1.0 always needs a second tape cartridge to back up a 40MB disk, even if the disk held less data than the tape theoretically holds, 38.5MB.
- Version 1.1 backs up only through the last used sector. Unused sectors may still get backed up, but none that are beyond the last used sector. Version 1.1 needs a second tape cartridge only when the last used sector is beyond the 38.5MB point on the disk. If, for example, you have 30MB of data to back up, only one tape is required.
