AppleFax Modem: Distribution List Capacity (9/93)

Article Created: 22 December 1989

Article Reviewed/Updated: 2 September 1993

TOPIC -----

I want to send a single Fax through the AppleFax Modem to 300 different locations. What is the maximum number of addresses that the AppleFax software can send to in one batch?

DISCUSSION -----

The mechanism within the AppleFax application to send an envelope containing a document or documents to multiple addresses is called a Distribution List. The Distribution List has a theoretical limit of an integer, or approximately 32K names; however, you will run out of memory (and patience) long before that.

We have successfully sent over 100 addresses in a single Distribution List. We don't have any experience with larger quantities or the testing resources to check this, but we don't know of any reason why it wouldn't work with the proper amount of memory.

You might create many smaller Distribution Lists, or try one list and monitor memory consumption and add memory as appropriate.
