Color StyleWriter Pro: ColorSync Matching Methods (3/94)

Article Created: 3 March 1994

TOPIC ---

This article explains each of the ColorSync Matching Methods on the Color
StyleWriter Pro printer.

DISCUSSION --

Photographic - Photographic matching is best for images with many different
               colors and shades, especially when the image included a
               neutral color (such as a white border). This method allows
               for better continuous tone changes from one color to
               another.

Business Graphics - Business Graphics matching is best for charts, graphs,
                    and other images with large areas of single colors.

Spot Color - Spot Color matching works best for images that have a large
             area of similar colors or shades of one color, and for images
             that do not include a neutral color (such as a white border).
             This method allows continuous tone consistency with any
             selected color. For example, a small background color behind a
             heading.
