Color LaserWriter 12/600 PS: Images Have Blue Tint (12/95)

Article Created: 13 October 1995

Article Reviewed/Updated: 18 December 1995

TOPIC -----

Why do all of my PhotoShop files that are converted to CMYK print with a bluish caste from the Color LaserWriter 12/600 PS printer? I have tried multiple versions of PhotoShop, but all have the same result.

DISCUSSION -----

There could be a couple of reasons why you see a bluish caste.

- Photoshop uses it's own color space conversion when you convert images from RGB to CMYK. A better solution is to keep the image in RGB space, which allows ColorSync to use the input and output device profiles for conversion when printing an image.
- Components of the file are based on a different monitor profile. In other words, some of the images in the file may have been imported from another file that had a different input profile. If this is the case, the colors are not being mapped properly. The images should be imported using the current environment profiles, and then printed using ColorSync Color Matching.
