LaserWriter IIf: Description (Discontinued)

Article Created: 1 October 1991

Article Last Reviewed:

Article Last Updated:

TOPIC -----

This article describes the LaserWriter IIf.

DISCUSSION -----

The 300 dpi (dots per inch) Apple LaserWriter IIf makes use of Apple's FinePrint technology to smooth jagged edges frequently found in laser-printed documents.

RAM

You can upgrade the LaserWriter IIf to 5MB RAM. The upgrade adds Apple's PhotoGrade capabilities and high-quality scanned images and graphics. PhotoGrade allows printing more than 65 levels of gray.

Networking

The LaserWriter IIf comes with built-in LocalTalk networking capabilities for use with an AppleTalk network system. The design of this printer allows simultaneous connection with multiple kinds of networks and computers. There's no need to manually reconfigure the printer to receive data through a particular port.

Performance

The LaserWriter IIf prints documents up to two times faster than the LaserWriter IINTX due to a high-speed controller and Adobe's PostScript Level 2 software. This generation of PostScript language improves printing speed, adds new capabilities, and is compatible with existing applications and drivers. The IIf is also compatible with the Hewlett Packard LaserJet IIP (PCL 4+) emulation software.
