Desktop Printing: Directories Created & Used (8/96)

Article Created: 26 August 1996

TOPIC -----

What directories are used and created by Desktop Printing? It looks as if some temporary subdirectories are created that are not visible. Are these temporary directories created for each Desktop Printer icon?

DISCUSSION -----

Here is a list that summarizes how Desktop Printing uses directories:

- A directory is created for each Desktop Printer. These directories are normal HFS directories with the exception of the icon and window in the Finder, and the items stored within it.
- DTP directories show up in the sfgetfile (File-Open dialog) and sfputfile (File-Save) dialogs.
- Any non-spool files placed into these directories WILL NOT be accessible in the Finder until Desktop Printing is disabled. This is because DTP is able to tell the Finder what to show and what not to show.
- Any non-spool files placed into these directories ARE accessible through sfgetfile/sfputfile. However, Apple recommends not using these directories to store non-spool files since files will not show up in the Finder.
- If DTP is disabled, the desktop printer directories will show up with an "X" through them, though will behave exactly like a folder (subdirectory).
- Future versions of Desktop Printing will place any unrecognized files on the desktop and alert you accordingly, as well as hide these DTP directories better, even from within sfgetfile/sfputfile.
