Laser Printers: Non-Apple Models and Driver Problems

Article Created: 26 March 1991

Article Last Updated:

TOPIC -----

I have a question about PostScript LaserWriter clones, in particular the ones by GCC, QMS, and Hewlett-Packard. All of these promise AppleTalk ports and true PostScript. The QMS printer even comes with Apple's LaserWriter drivers. What are the possible disadvantages to these non-Apple printers?

DISCUSSION -----

Most of the problems originate with the software drivers, because the hardware is sitting off by itself with only the LocalTalk connection as a compatibility factor. Because LocalTalk is well documented, you won't find too many problems there.

The drivers are the biggest concern, because developers write their applications assuming that a printer driver will adhere to a certain set of protocols. In addition, the driver needs to interact with the system software. That implies yet another set of standard protocols.
