PostScript: Displaying It on the Macintosh Screen

This article last reviewed: 16 June 1988

Macintosh print drivers let you view PostScript commands for editing
purposes. Before printing, press and hold the Command and "F" keys after
selecting OK from the print dialog box. You'll see the message "Creating
PostScript File." The file is named PostScript0, PostScript1, etc. -- a
standard text file that can be opened by most word processing and text
editing programs.

Apple has no plans to display graphics based on PostScript language
routines. Nor are any third-party companies working on such a large
project. This capability would require a rewrite of the Macintosh
operating system so that it displayed graphics via PostScript instead of
QuickDraw.
