StyleWriter II: Compatibility and Performance

Article Created: 6 January 1993

TOPIC ---

This article discusses the StyleWriter II's compatibility.

DISCUSSION --

Software Compatibility

The StyleWriter II requires System 7, or System 6.0.7/6.0.8 with the TrueType
INIT installed. The TrueType INIT is included with the StyleWriter II printer
drivers. Color Macintosh computers must have 32-bit QuickDraw to work
properly.

The StyleWriter II can use Adobe Type 1 and TrueType fonts, including fonts in
a two-byte format. Adobe Type 1 fonts require the use of Adobe Type Manager

Performance

For best performance, Macintosh systems should have more than 2MB of RAM
with System 6.0.7/6.0.8, or more than 4MB of RAM with System 7.

As with the StyleWriter printer, the StyleWriter II's performance is
directly related to the type of Macintosh used and the complexity of the
document. As a general rule, the faster the CPU and the simpler the document,
the faster the StyleWriter II will print.
