

Installing System 7.5 Update 2.0

Before installing System 7.5 Update 2.0, follow the steps listed below to ensure a trouble-free installation:

- 1 Run a utility such as Disk First Aid, Norton Utilities, or Central Point Tools on the target volume and repair any found problems.
- 2 Make sure the disk formatting software you are using is compatible with System Software 7.5.3. The System 7.5 Update 2.0 includes Apple's HD SC Setup and Drive Setup applications, but if you are using 3rd party formatting software, you should check with that vendor for compatibility information.
- 3 Use the Extensions Manager control panel to temporarily turn off 3rd party extensions and control panels. If your current system software is 7.5 or 7.5.1, choose "System 7.5 only" from the pop-up menu. If your current system software is 7.5.2, choose "System 7.5.2" from the pop-up menu.
- 4 Many software security utilities may need to be disabled or removed before installing the System 7.5 Update 2.0. Check with individual vendors for compatibility information.
- 5 Read detailed installation instructions in the ReadMe file entitled "Installing This Update."
